Coverage Rationale

Note: This policy applies to services provided in a dental office. For anesthesia services provided in a hospital operating room or ambulatory surgery center, refer to the member specific benefit plan document and any applicable federal or state mandates.

Nitrous Oxide

Nitrous oxide may be indicated for the following:
- Extensive and/or complex procedures
- Individuals with physical, cognitive, or developmental disabilities
- Ineffective Local Anesthesia
- Management of a severe gag reflex
- Management of fear and anxiety

Nitrous oxide may be contraindicated for, but not limited to, the following:
- Claustrophobia
- Pregnancy
- Severe underlying medical conditions
- Significant personality and behavioral disorders
- Upper respiratory tract infections or other respiratory conditions

Nitrous oxide is an absolute contraindication for the following:
- Metheneteraydrofylolate reductase (MTHFR) deficiency
- Pulmonary hypertension
- Severe Chronic Obstructive Pulmonary Disease (COPD)
- Treatment with bleomycin sulfate
- Vitamin B12 deficiency
- Within 3 months vitreoretinal surgery

Intravenous Moderate/Conscious Sedation and Deep Sedation/General Anesthesia

Intravenous Moderate/Conscious Sedation and Deep Sedation/General Anesthesia may be indicated for the following:
- Allergy or sensitivity to local anesthetic agents
• Extensive and/or complex procedures
• Extreme anxiety and fear, or behavioral management when other techniques have proven inadequate
• Individuals that are medically compromised or those with special needs
• Lengthy restoration procedures for pediatric members
• Management of severe gag reflex if nitrous oxide is ineffective or not indicated
• Pain control when other techniques have proven inadequate

Intravenous Moderate/Conscious Sedation and Deep Sedation/General Anesthesia are contraindicated if there is an increased risk of adverse outcome or complications.

Non-Intravenous Sedation

Non-intravenous sedation may be indicated for the following situations:
• Individuals with physical, cognitive, or developmental disabilities
• Mild to moderate apprehension and anxiety

Non-intravenous sedation is contraindicated if there is an increased risk of adverse outcome or complications.

Definitions

Deep Sedation: A drug-induced depression of consciousness during which patients cannot be easily aroused but respond purposefully following repeated or painful stimulation. The ability to independently maintain ventilatory function may be impaired. Patients may require assistance in maintaining a patent airway, and spontaneous ventilation may be inadequate. Cardiovascular function is usually maintained. (ASA)

General Anesthesia: A drug-induced loss of consciousness during which patients are not arousable, even by painful stimulation. The ability to independently maintain ventilator function is often impaired. Patients often require assistance in maintaining a patent airway, and positive pressure ventilation may be required because of depressed spontaneous ventilation or drug-induced depression of neuromuscular function. Cardiovascular function may be impaired. (ASA)

Local Anesthesia: The elimination of sensation, especially pain, in one part of the body by the topical application or regional injection of a drug. (ADA)

Minimal Sedation: Is a drug-induced state during which patients respond normally to verbal commands. Although cognitive function and physical coordination may be impaired, airway reflexes, and ventilatory and cardiovascular functions are unaffected. (ASA)

Moderate Sedation (“Conscious Sedation”): A drug-induced depression of consciousness during which patients respond purposefully to verbal commands, either alone or accompanied by light tactile stimulation. No interventions are required to maintain a patent airway, and spontaneous ventilation is adequate. Cardiovascular function is usually maintained. (ASA)

Applicable Codes

The following list(s) of procedure and/or diagnosis codes is provided for reference purposes only and may not be all inclusive. Listing of a code in this guideline does not imply that the service described by the code is a covered or non-covered health service. Benefit coverage for health services is determined by the member specific benefit plan document and applicable laws that may require coverage for a specific service. The inclusion of a code does not imply any right to reimbursement or guarantee claim payment. Other Policies and Guidelines may apply.

### Description of Services

The administration of local anesthetic is common and used for most routine dental procedures. For some patients, various levels of sedation and/or anesthesia may be necessary to safely provide dental care. These procedures generally are safe when administered by trained, certified providers in the appropriate setting, but are not without risk. According to the American Dental Association (ADA), dentists must comply with their state laws, rules and/or regulations when providing sedation and anesthesia and follow the educational and training requirements for the level of sedation intended. The ADA maintains clinical guidelines and educational/training requirements for all levels of sedation and includes specific information for the following:

- Patient history and evaluation
- Personnel and equipment requirements
- Monitoring and documentation (including consciousness, oxygenation, ventilation, and circulation)
- Recovery and discharge
- Emergency management

This guideline can be found at: [https://www.ada.org/-/media/project/ada-organization/ada/ada.org/files/resources/research/ada_sedation_use_guidelines.pdf?rev=313932b4f5eb49e491926d4f00a14&hash=C7C55D7182C639197569D4ED8EDCDDF6](https://www.ada.org/-/media/project/ada-organization/ada/ada.org/files/resources/research/ada_sedation_use_guidelines.pdf?rev=313932b4f5eb49e491926d4f00a14&hash=C7C55D7182C639197569D4ED8EDCDDF6). (Accessed June 26, 2023)

According to the American Academy of Pediatric Dentistry (AAPD), the sedation of children is different from the sedation of adults, and the in-office use of deep sedation or General Anesthesia may be appropriate on select pediatric dental patients administered in appropriately equipped and staffed facilities. The Guideline for Monitoring and Management of Pediatric Patients Before, During, and After Sedation for Diagnostic and Therapeutic Procedures addresses pediatric specific considerations and was developed in conjunction with the American Academy of Pediatrics (AAP). The AAPD guideline highlights the higher risks of adverse outcomes associated with sedation of pediatric patients and emphasizes the steps and actions needed to minimize the risks. This guideline can be found at: [https://www.aapd.org/globalassets/media/policies_guidelines/bp_monitoringsedation.pdf](https://www.aapd.org/globalassets/media/policies_guidelines/bp_monitoringsedation.pdf). (Accessed June 26, 2023)

Additionally, the following are some of the recommendations from the American Society of Anesthesiologists focusing on appropriate patient selection, quality anesthesia care and patient safety in the dental office:

- Pediatric patients and adults with major medical problems (ASA Physical Status III and above) are at higher risk of adverse events than other patients. For these high-risk patients and younger pediatric patients, ASA recommends evaluation by a primary care physician or physician anesthesiologist prior to scheduling a procedure.
- Prolonged and extensive procedures with longer periods of sedation and anesthesia care are of concern in the office-based setting and qualified anesthesia providers, in consultation with such patients, should consider more suitable facilities for the procedure.
- Personnel with training in advanced resuscitative techniques (e.g., ACLS, PALS) should be immediately available until all patients are discharged home. A designated individual, other than the individual performing the procedure, should be present to monitor the patient throughout procedures performed with sedation. During deep sedation and/or General Anesthesia, this individual should have no other responsibilities.
- At a minimum, all facilities should have a reliable source of oxygen, suction, resuscitation equipment and emergency drugs.
Ensure there is a protocol for accessing emergency medical services, managing life-threatening complications, and maintaining emergency life support/rescue services.

Pursuant to CA AB2585: While not common in dentistry, nonpharmacological pain management strategies should be encouraged if appropriate.

### Instructions for Use

This Dental Coverage Guideline provides assistance in interpreting UnitedHealthcare standard dental benefit plans. When deciding coverage, the member specific benefit plan document must be referenced as the terms of the member specific benefit plan may differ from the standard dental plan. In the event of a conflict, the member specific benefit plan document governs. Before using this guideline, please check the member specific benefit plan document and any applicable federal or state mandates. UnitedHealthcare reserves the right to modify its Policies and Guidelines as necessary. This Dental Coverage Guideline is provided for informational purposes. It does not constitute medical advice.
