Antiemetics for Oncology

Policy Number: ADMINISTRATIVE 291.1 T0
Effective Date: August 1, 2021

Coverage Rationale

This policy refers to the following products used as antiemetics for oncology use:

- Akynzeo® (palonosetron/fosnetupitant) injection
- Akynzeo® (palonosetron/netupitant) capsule
- Aloxi® (palonosetron) injection
- Cinvanti™ (aprepitant) injectable emulsion
- Emend® (fosaprepitant) injection, capsule
- Sustol® (granisetron extended release) injection
- Kytril® (granisetron) injection, tablets
- Varubi® (rolapitant) tablet
- Zofran® (ondansetron) injection, tablets

Inclusion of oral antiemetics in this policy and application of the preferred product criteria to them is limited to when these are administered prior to the chemotherapy infusion and not when they are self-administered by the patient outside of the infusion.

Preferred Product Criteria
Treatment with non-preferred NK1 RA, 5HT3 RA, or NK1 RA/5HT3 RA combination product is medically necessary for the indications specified in the policy when one of the following is met:

- Both of the following:
  - History of a trial of adequate dose and duration of preferred NK1 RA or 5HT3 RA product, resulting in minimal clinical response; and
  - Physician attests that, in their clinical opinion, the clinical response would be expected to be superior with non-preferred NK1 RA, 5HT3 RA, or NK1 RA/5HT3 RA combination product, than experienced with preferred NK1 RA or 5HT3 RA.

- Both of the following:
  - History of intolerance, contraindication, or adverse event to preferred NK1 RA or 5HT3 RA; and
  - Physician attests that, in their clinical opinion, the same intolerance, contraindication, or adverse event would not be expected to occur with non-preferred NK1 RA, 5HT3 RA, or NK1 RA/5HT3 RA combination product.

Diagnosis-Specific Criteria
For the coverage criteria below, in absence of specified drug products, the term “antiemetics” will be used in this policy where the coverage criteria apply to all products listed above.

Antiemetics are proven and medically necessary for the following indications:

- **NK1 RA** (Emend, Cinvanti, Varubi) may be indicated when one of the following are present:
  - Both of the following:
    - Prevention of chemotherapy-induced nausea and vomiting due to high emetic risk parenteral anticancer agents;
    - In combination with a 5HT3 RA

- All of the following:
  - Prevention of chemotherapy-induced nausea and vomiting due to moderate emetic risk parenteral anticancer agents;
  - In combination with a 5HT3 RA;
  - One of the risk factors for anticancer-agent induced nausea/vomiting
    - Younger age (< 55 years)
    - Female sex
    - Previous history of chemotherapy induced nausea or vomiting
    - Little or no previous alcohol use
    - History of motion sickness or morning sickness during pregnancy
    - High anxiety

- **5HT3 RA** (Aloxi, Kytril, Sustol, Zofran) may be indicated when one of the following are present:
  - Both of the following:
    - Prevention of chemotherapy-induced nausea and vomiting due to high emetic risk parenteral anticancer agents;
    - In combination with a NK1 RA

or
o Prevention of chemotherapy-induced nausea and vomiting due to moderate emetic risk parenteral anticancer agents\(^\text{11}\); or

o All of the following:
  \- Prevention of chemotherapy-induced nausea and vomiting due to moderate emetic risk parenteral anticancer agents\(^\text{11}\); and
  \- In combination with a NK1 RA; and
  \- One of the risk factors for anticancer-agent induced nausea/vomiting
    \- Younger age (< 55 years)
    \- Female sex
    \- Previous history of chemotherapy induced nausea or vomiting
    \- Little or no previous alcohol use
    \- History of motion sickness or morning sickness during pregnancy
    \- High anxiety

or

o Treatment of breakthrough nausea and/or vomiting due to anticancer agent(s)

• NK1 RA/5HT3 RA combination (Akynzeo) may be indicated when one of the following are present:

  o All of the following:
    \- Prevention of chemotherapy-induced nausea and vomiting due to moderate emetic risk parenteral anticancer agents\(^\text{11}\); and
    \- One of the risk factors for anticancer-agent induced nausea/vomiting
      \- Younger age (< 55 years)
      \- Female sex
      \- Previous history of chemotherapy induced nausea or vomiting
      \- Little or no previous alcohol use
      \- History of motion sickness or morning sickness during pregnancy
      \- High anxiety
    

Definitions

**Acute Emesis:** nausea and/or vomiting that occurs within a few minutes to several hours after administration of certain anticancer agents and commonly resolves with the first 24 hours

**Delayed Emesis:** nausea and/or vomiting that occurs more than 24 hours after anticancer agents

**High Emetic Risk:** more than 90% of patients experience acute emesis

**Moderate Emetic Risk:** more than 30% to 90% of patients experience acute emesis

**Low Emetic Risk:** 10% - 30% of patients experience acute emesis

**Minimal Emetic Risk:** fewer than 10% of patients experience acute emesis

Prior Authorization Requirements

**J0185, J1453, J1454, J1627, J2469, J8501, J8670, J8655**

The prior authorization requirements below apply to the following drugs:

- Akynzeo\(^\dagger\) (palonosetron/fosnetupitant) injection
- Akynzeo\(^\dagger\) (palonosetron/netupitant) capsule
- Aloxi\(^\dagger\) (palonosetron) injection
- Cinvanti\(^\text{TM}\) (aprepitant) injectable emulsion
- Emend\(^\dagger\) (fosaprepitant) injection, capsule

Antiemetics for Oncology
UnitedHealthcare Oxford Clinical Policy

©1996-2021, Oxford Health Plans, LLC

Effective 08/01/2021
Sustol® (granisetron extended release) injection
Varubi® (rolapitant) tablet

For dates of service prior to Aug. 1, 2021, prior authorization is not required, however it is strongly recommended for the drugs listed above when these medications are administered prior to the chemotherapy infusion (not when they are self-administered by the patient outside of the infusion). While no penalty will be imposed for failure to request a pre-service review, if one is not requested, a medical necessity review will be conducted post-service to determine coverage. It is the referring physician's responsibility to provide medical documentation to demonstrate clinical necessity for the medication. Refer to the Clinical Policy titled Review at Launch for New to Market Medications.

For dates of service on or after Aug. 1, 2021, prior authorization is required for the drugs listed above when these medications are administered prior to the chemotherapy infusion, and not when they are self-administered by the patient outside of the infusion.

All prior authorization requests for the above antiemetics for oncology are handled by Optum. Providers are encouraged to obtain prior authorization through uhcprovider.com, log in and access the Prior Authorization and Notification tool. Then select the “Radiology, Cardiology + Oncology” box and you’ll be directed to a new website to process these authorization requests. Requests can be submitted online beginning July 30, 2021 for dates of service on or after August 1, 2021. For members with an alpha-numeric Group Number, providers should obtain prior authorization by calling the number on the back of the members ID card. Providers may also obtain prior authorization by calling 1-888-397-8129.

J1626, J25405, Q0162, Q0166

Prior authorization is not required for the following drugs when these medications are administered prior to the chemotherapy infusion:

- Kytril® (granisetron) injection, tablets
- Zofran® (ondansetron) injection, tablets

### Applicable Codes

The following list(s) of procedure and/or diagnosis codes is provided for reference purposes only and may not be all inclusive. Listing of a code in this policy does not imply that the service described by the code is a covered or non-covered health service. Benefit coverage for health services is determined by the member specific benefit plan document and applicable laws that may require coverage for a specific service. The inclusion of a code does not imply any right to reimbursement or guarantee claim payment. Other Policies may apply.

</table>
### Description of Services

Anticancer related emesis can significantly affect patient’s quality of life and lead to poor compliance of therapy. The incidence and severity of nausea and/or vomiting in patients receiving anticancer agents and/or radiation therapy (RT) can be affected by many factors, including: 1) the specific therapeutic agents used; 2) dosage of the agents; 3) schedule and the route of administration of the agents; 4) target of the RT (e.g., whole body, upper abdomen); 5) individual patient variability (e.g., younger age, female sex, prior anticancer agents, history of alcohol use, morning sickness, motion sickness, anxiety).

### Neurokinin 1 Receptor Antagonist (NK1 RA)

Aprepitant is a highly selective antagonist of neurokinin 1 (NK1) receptors. By blocking the activity of substance P at neurokinin 1 receptors, aprepitant is thought to prevent the onset of nausea and vomiting. Fosaprepitant is a prodrug of aprepitant that is rapidly converted to aprepitant.

### 5-Hydroxytryptamine Receptor Antagonist (5HT3 RA)

Palonosetron, granisetron, and ondansetron are 5-hydroxytryptamine (5-HT3) receptor antagonist. By blocking the activity of serotonin at 5-HT3 receptors in the central nervous system and gastrointestinal tract, these agents are thought to prevent the onset of nausea and vomiting.

### NK1 RA and 5HT3 RA combination

Akynzeo is a combination product of a 5-HT3 receptor antagonist (palonosetron) and an NK1 receptor antagonist (netupitant or fosnetupitant).

### Benefit Considerations

Some Certificates of Coverage allow for coverage of experimental/investigational/unproven treatments for life-threatening illnesses when certain conditions are met. The member specific benefit plan document must be consulted to make coverage decisions for this service. Some states mandate benefit coverage for off-label use of medications for some diagnoses or under some circumstances when certain conditions are met. Where such mandates apply, they supersede language in the benefit document or in the medical or drug policy. Benefit coverage for an otherwise unproven service for the treatment of serious rare diseases may occur when certain conditions are met. See the Administrative Policy titled [Acquired Rare Disease Drug Therapy Exception Process](#).
Clinical Evidence

National Comprehensive Cancer Network²⁵

The National Comprehensive Cancer Network (NCCN) publishes clinical practice guidelines for Oncology (NCCN Guidelines®) specific to antiemesis related to cancer treatments.²⁵ National Comprehensive Cancer Network (NCCN) provides recommendations for antiemetic therapy regimens based on the emetogenic risk of the chemotherapy and if it is intravenous or oral. The emetogenic risk of intravenous anticancer agents is based on the frequency of emesis.

High emetic risk agents have a greater than 90% frequency of emesis. Moderate emetic risk has a 30-90% frequency of emesis while low emetic risk has 10 – 30% frequency of emesis, and minimal emetic risk have less than 10% frequency of emesis. For oral antineoplastic agents, the levels are divided into those with moderate to high emetic risk (greater than or equal to 30% frequency of emesis) and minimal to low emetic risk (less than 30% frequency of emesis). (NCCN, 2020)

For high emetic risk parenteral (IV) anticancer agents, NCCN recommends several options for acute and delayed emesis prevention without a preference given to one regimen over another. Regimens recommended include either aprepitant oral or IV, fosaprepitant IV, or rolapitant oral in combination with a 5-HT3 receptor antagonist (palonosetron IV; granisetron subcutaneous [SQ], oral, IV or transdermal; or ondansetron oral or IV) with dexamethasone oral or IV. Other options include netupitant/palonosetron oral or fosnetupitant/palonosetron IV in combination with dexamethasone; olanzapine oral with palonosetron IV and dexamethasone oral or IV; or aprepitant oral or IV, fosaprepitant IV, or rolapitant oral in combination with a 5-HT3 receptor antagonist, dexamethasone oral or IV, and olanzapine. (NCCN, 2019) For moderate emetic risk parenteral anticancer agents, several options are recommended without preference for acute and delayed emesis prevention. One option recommends a 5-HT3 receptor antagonist in combination with dexamethasone oral or IV. NCCN notes a preference for palonosetron IV or granisetron extended-release injection when an NK1 antagonist is not used in combination with 5-HT3 antagonist. Other options include use of aprepitant oral or IV, fosaprepitant IV, rolapitant oral in combination with a 5-HT3 receptor antagonist and dexamethasone oral or IV; netupitant/palonosetron oral or fosnetupitant/palonosetron IV in combination with dexamethasone; or olanzapine oral with palonosetron IV and dexamethasone oral or IV. (NCCN, 2020) For low emetic risk parenteral anticancer agents, NCCN recommends dexamethasone oral or IV; metoclopramide oral or IV; prochlorperazine oral or IV; or an oral 5-HT3 receptor antagonist. Routine prophylaxis is not recommended for minimal emetic risk parenteral anticancer agents. (NCCN, 2020) For high to moderate emetic risk with oral anticancer agents, NCCN recommends a 5-HT3 receptor antagonist (dolasetron oral, granisetron oral or transdermal, or ondansetron oral). For low to minimal risk with oral anticancer agents, as needed treatment is recommended initially with recommendations to use either metoclopramide oral as needed, prochlorperazine oral as needed, or an oral 5-HT3 antagonist as needed provided when nausea/vomiting is experienced. (NCCN, 2020) If breakthrough chemotherapy-induced nausea and vomiting occurs, recommendations for subsequent chemotherapy cycles include changing the antiemetic regimen to a higher level for primary treatment. (NCCN, 2020)

NCCN listed high emetic risk regimens (>90% frequency of emesis)
- AC combination defined as any chemotherapy regimen that contains anthracycline and cyclophosphamide
- Carboplatin AUC ≥ 4
- Carmustine > 250 mg/m²
- Cisplatin
- Cyclophosphamide > 1500 mg/m²
- Dacarbazine
- Doxorubicin ≥ 60 mg/m²
- Epirubicin > 90 mg/m²
- Ifosfamide ≥ 2 g/m² per dose
- Mechlorethamine
- Streptozocin

NCCN listed moderate emetic risk regimens (>30% - 90% frequency of emesis)
- Aldesleukin > 12 – 15 million IU/m²
- Amifostine > 300 mg/m²
- Azacitidine
- Bendamustine
American Society of Clinical Oncology\textsuperscript{26}

The American Society of Clinical Oncology (ASCO) has published guidelines for antiemetics in oncology after conducting a systematic review by an expert panel of forty-one publications (35 randomized control trials and 6 meta-analysis). The guideline addresses the prevention and management of nausea and vomiting due to antineoplastic agents and/or radiation therapy in patients with cancer.

For high emetic risk antineoplastic agents, ASCO guidelines recommend a four-drug combination (an NK1 receptor antagonist, a 5-HT3 receptor antagonist, dexamethasone, and olanzapine) with dexamethasone and olanzapine to be continued on days 2 – 4; high quality of evidence and strong strength of recommendations. In addition, patients who are treated with anthracycline and cyclophosphamide combination should be offered a four-drug antiemetic combination (an NK1 receptor antagonist, a 5-HT3 receptor antagonist, dexamethasone, and olanzapine) with olanzapine continued on days 2 – 4; high quality of evidence and strong strength of recommendations.

For moderate emetic risk antineoplastic agents, especially those treated with carboplatin area under the curve (AUC) ≥ 4 mg/ml per minute, ASCO guidelines recommend a 3-drug combination (an NK1 receptor antagonist, a 5-HT3 receptor antagonist, and dexamethasone). Those treated with moderate emetic risk antineoplastic agents excluding carboplatin AUC ≥ 4 mg/ml per minute, ASCO guidelines recommend a 2-drug combination (a 5-HT3 receptor antagonist and dexamethasone); high quality of evidence and strong strength of recommendations.

For low emetic risk antineoplastic agents, ASCO guidelines recommend single agents (a 5-HT3 receptor antagonist or dexamethasone); low quality of evidence and moderate strength of recommendations.

For minimal emetic risk antineoplastic agents, ASCO guidelines recommend no routine antiemetic prophylaxis; low quality of evidence and moderate strength of recommendation.

For breakthrough nausea and vomiting, ASCO guidelines recommend evaluating emetic risk, disease status, concurrent illnesses, and medications, and ascertain that the best regimen is being administered for the emetic risk. Those who experience nausea or vomiting despite optimal prophylaxis, and who did not receive olanzapine prophylactically, should be offered olanzapine in addition to continuing the standard antiemetic regimen; intermediate quality of evidence and moderate strength of recommendation. Additionally, those who experience nausea or vomiting despite optimal prophylaxis, and who

- Busulfan
- Carboplatin AUC < 4
- Carmustine ≤ 250 mg/m\(^2\)
- Clofarabine
- Cyclophosphamide ≤ 1500 mg/m\(^2\)
- Cytarabine > 200 mg/m\(^2\)
- Daunorubicin
- Dual-drug liposomal encapsulation of cytarabine and daunorubicin
- Dinutiximab
- Doxorubicin < 60 mg/m\(^2\)
- Enfortumab vedotin-ejfv
- Epirubicin ≤ 90 mg/m\(^2\)
- Fam-trastuzumab deruxtecan
- Idarubicin
- Ifosfamide < 2 g/m\(^2\) per dose
- Interferon alfa ≥ 10 million IU/m\(^2\)
- Irinotecan
- Irinotecan (liposomal)
- Melphalan
- Methotrexate ≥ 250 mg/m\(^2\)
- Oxaliplatin
- Temozolomide
- Trabectedin
have already received olanzapine, may be offered a drug of a different class—for example, an NK1 receptor antagonist, lorazepam or alprazolam, a dopamine receptor antagonist, dronabinol, or nabilone—in addition to continuing the standard antiemetic regimen; intermediate quality of evidence for dronabinol and nabilone and low otherwise and moderate strength of recommendation. (ASCO, 2017)

U.S. Food and Drug Administration (FDA)

This section is to be used for informational purposes only. FDA approval alone is not a basis for coverage.

Akynzeo® (palonosetron/netupitant) capsule is a combination of selective 5-HT3 receptor antagonist and substance P/neurokinin 1 receptor antagonist indicated in combination with dexamethasone in adults for the prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of cancer chemotherapy, including, but not limited to, highly emetogenic chemotherapy.

Akynzeo® (palonosetron/fosnetupitant) injection is a combination of selective 5-HT3 receptor antagonist and substance P/neurokinin 1 receptor antagonist indicated in combination with dexamethasone in adults for the prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic cancer chemotherapy. Akynzeo injection has not been studied for the prevention of nausea and vomiting associated with anthracycline plus cyclophosphamide chemotherapy.

Cinvanti® (aprepitant) emulsion is a substance P/neurokinin-1 (NK1) receptor antagonist, indicated in adults, in combination with other antiemetic agents, for the prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic cancer chemotherapy (HEC) including high dose cisplatin and nausea and vomiting associated with initial and repeat courses of moderately emetogenic cancer chemotherapy (MEC). CINVANTI has not been studied for treatment of established nausea and vomiting.

EMEND® (fosaprepitant) injection is a substance P/neurokinin-1 (NK1) receptor antagonist, indicated in adults and pediatric patients 6 months of age and older, in combination with other antiemetic agents, for the prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic cancer chemotherapy (HEC) including high-dose cisplatin and delayed nausea and vomiting associated with initial and repeat courses of moderately emetogenic cancer chemotherapy (MEC). EMEND has not been studied for treatment of established nausea and vomiting.

Emend® (aprepitant) capsules is a substance P/neurokinin-1 (NK1) receptor antagonist, indicated in combination with other antiemetic agents, in patients 12 years of age and older for prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic cancer chemotherapy (HEC) including high-dose cisplatin nausea and vomiting associated with initial and repeat courses of moderately emetogenic cancer chemotherapy (MEC).

Varubi® (rolapitant) tablet is a substance P/neurokinin 1 (NK1) receptor antagonist indicated in combination with other antiemetic agents in adults for the prevention of delayed nausea and vomiting associated with initial and repeat courses of emetogenic chemotherapy, including, but not limited to, highly emetogenic chemotherapy.

Aloxi® (palonosetron) injection is a serotonin subtype 3 (5-HT3) receptor antagonist indicated in adults for moderately emetogenic cancer chemotherapy—prevention of acute and delayed nausea and vomiting associated with initial and repeat courses, highly emetogenic cancer chemotherapy—prevention of acute nausea and vomiting associated with initial and repeat courses, and prevention of postoperative nausea and vomiting (PONV) for up to 24 hours following surgery. Efficacy beyond 24 hours has not been demonstrated. Aloxi is also indicated in pediatric patients aged 1 month to less than 17 years for prevention of acute nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy, including highly emetogenic cancer chemotherapy.

Aloxi® (palonosetron) capsules is a serotonin subtype 3 (5-HT3) receptor antagonist, indicated for moderately emetogenic cancer chemotherapy—prevention of acute nausea and vomiting associated with initial and repeat courses.

Sustol® (granisetron extended release) injection is a serotonin-3 (5-HT3) receptor antagonist indicated in combination with other antiemetics in adults for the prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of...
moderately emetogenic chemotherapy (MEC) or anthracycline and cyclophosphamide (AC) combination chemotherapy regimens.

Kytril® (granisetron) injection is a serotonin-3 (5-HT3) receptor antagonist indicated for the prevention of nausea and/or vomiting associated with initial and repeat courses of emetogenic cancer therapy, including high-dose cisplatin and for the prevention and treatment of postoperative nausea and vomiting in adults.

Zofran® (ondansetron) oral solution, tablets, and orally disintegrating tablets are 5-HT3 receptor antagonist indicated for the prevention of nausea and vomiting associated with highly emetogenic cancer chemotherapy, including cisplatin greater than or equal to 50 mg/m², nausea and vomiting associated with initial and repeat courses of moderately emetogenic cancer chemotherapy, nausea and vomiting associated with radiotherapy in patients receiving either total body irradiation, single high-dose fraction to the abdomen, or daily fractions to the abdomen, or postoperative nausea and/or vomiting.

Zofran® (ondansetron) injection is a 5-HT3 receptor antagonist indicated for prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy and prevention of postoperative nausea and/or vomiting.

Instructions for Use

This Clinical Policy provides assistance in interpreting UnitedHealthcare Oxford standard benefit plans. When deciding coverage, the member specific benefit plan document must be referenced as the terms of the member specific benefit plan may differ from the standard plan. In the event of a conflict, the member specific benefit plan document governs. Before using this policy, please check the member specific benefit plan document and any applicable federal or state mandates. UnitedHealthcare Oxford reserves the right to modify its Policies as necessary. This Clinical Policy is provided for informational purposes. It does not constitute medical advice.

The term Oxford includes Oxford Health Plans, LLC and all of its subsidiaries as appropriate for these policies. Unless otherwise stated, Oxford policies do not apply to Medicare Advantage members.

UnitedHealthcare may also use tools developed by third parties, such as the InterQual™ criteria, to assist us in administering health benefits. UnitedHealthcare Oxford Clinical Policies are intended to be used in connection with the independent professional medical judgment of a qualified health care provider and do not constitute the practice of medicine or medical advice.
